

## **Foraging-API Documentation**

The foraging-API I built helps ease the process of foraging for food. With the basic features rolled out in foraging-1.0 you can:

### **Current features for the foraging-API**

- Search for foraged items.
  - If item does not exist, you can upload it into the system.
  - Can update past entries if information is not accurate.
  - Deleting an entry is also a possibility with the items name.
- 
- Can return a list of user uploaded reviews for a specified foraged item.
  - If the review you were looking for doesn't exist you can upload your own.
- 
- Currently gives you the ability to return a list of locations off of a requested season.
  - Can upload your own location for foraging.

### **Future features for the Foraging-API**

- In future updates I hope to implement the ability to attach images to foraged items.
- & have users be able to upload images to reviews.
- Have a more in-depth connection between foraged items and locations.
- The ability to update previous locations.
- Alter or delete previous reviews left.
